**Subject: Request for Validation of dataset for Thesis Study**

Dear Sir,

Greetings!

We are undergraduate researchers from the BS Computer Science program at Camarines Sur Polytechnic Colleges, currently developing our thesis titled ***"ThemeSync: A Graph-Based Design Orchestration Framework with Real-Time Constraint Satisfaction and Stateful Refinement."*** As part of our system's development, we trained a computer vision model to detect logos, text, decorative panels, and small embellishments on real event-poster designs, using a dataset of 124 images that we hand-annotated. To strengthen the validity of this dataset, we respectfully request your expertise in reviewing a small sample of our annotations.

We kindly request your thorough review of 15 sample images with their bounding-box annotations, ensuring that each annotation is correctly placed and categorized according to the provided class definitions. Using the attached validation form, please indicate any inaccuracies, unclear cases, or inconsistencies you observe. In addition, we would greatly value your assessment of the evaluation metric outlined in our thesis manuscript, particularly regarding its accuracy and proper application. Your expert feedback will be formally acknowledged in our thesis and is deeply appreciated as it will strengthen the rigor and credibility of our study.

For your convenience, we have included **sample images** with annotations, the corresponding **annotation** class definitions, and a **one-page validation** form to support your review and responses. Please feel free to reach out should you require any clarification.

Thank you very much for your time and support.

Respectfully yours,

**Michelle S. Tercero**

# Annotation Class Definitions

Thank you for taking the time to look at this. This document accompanies a sample of annotated master-layout images from ThemeSync, a system that extracts a poster's visual theme (colors, logo placement, decorative style) and reapplies it to a different document, such as a certificate or ID. Before we develop that extraction step further, we'd really value an outside, informed check on whether the bounding-box annotations on our sample images match the class definitions below — a second set of eyes beyond our own group.

We'd be grateful if you could look at whether each box correctly captures the element it claims to, and whether anything seems miscategorized or missing. No need for anything exhaustive — your honest impressions are what we're after.

## What you're reviewing

Each image is a "master layout" — a generic branded design such as an event poster, banner, letterhead, or social-media announcement graphic. On each one, our group has drawn bounding boxes around specific visual elements and labeled each box with one of four classes (defined below). We'd appreciate you checking those boxes and labels against the definitions below, rather than judging the poster's design quality itself.

## The four classes

| Class | What it should cover |
|---|---|
| **logo** | An institutional/organizational seal, crest, or logo graphic. The box should be tight around the visible graphic itself, not the surrounding whitespace. If a poster has more than one logo (e.g., a school seal plus a student council logo), each gets its own box. |
| **text** | One box per semantically distinct block of text — not per character or per line, and not one box around the whole page. For example, an event poster might have separate text boxes for the organization name, a sub-header, the event title, a tagline, a date/venue callout, and a footer contact line. Each of those is its own box. |
| **underlay** | A colored or shaded panel/bar placed directly behind a specific piece of text or a logo, to improve contrast or legibility — for example, a dark rounded rectangle sitting behind a tagline. This is **not** the poster's full background photo or illustration, no matter how large, colorful, or central it |

| | |
|---|---|
| | is to the design. A big illustrated scene or a plain background color is base artwork, not an underlay, and should not be boxed at all. |
| **embellishment** | Small decorative accents: thin decorative lines, small icons or dots, corner flourishes, or a social-media platform icon next to a handle. These are minor and intentionally not exhaustively annotated (please see the note below) — flagging one is only needed if it's clearly present and clearly unboxed, not every small mark on the page. |

**A key rule that applies across all four classes:** the full background image or illustration of a poster is never boxed as anything. Only overlay elements sitting on top of that background — a logo, a text block, a contrast panel, a decorative accent — get boxes.

## What we're hoping you'll check

If you're willing, we'd appreciate a look at each of the following for the boxes in the sample:

1. **Right class.** Does the label match the definitions above? (The most common mix-up to watch for: a large background illustration mislabeled as `underlay` — it shouldn't be boxed at all.)
2. **Tight fit.** Does the box hug the actual visible content, without a lot of extra margin, and without cutting off part of the element?
3. **Nothing missing.** Is there a logo, text block, contrast panel, or obvious decorative accent on the page that has no box at all?
4. **Nothing that shouldn't be there.** Is there a box around something that doesn't match any of the four definitions (most likely: a box drawn around the background art)?
5. **Text segmentation makes sense.** For multi-line or multi-part text, does the split into separate boxes match how a reader would naturally group the words (e.g., headline vs. tagline vs. date line), rather than an arbitrary or inconsistent split?

If most images look consistent with the definitions and only a few issues turn up, that's genuinely useful feedback on its own — this doesn't need to be a clean-or-broken verdict, just your honest read against the table above. Thank you again for helping us with this — we really appreciate you sharing your expertise.
